

Graduation Preparation

Jovi Simons

Internship

My previous internship was at Any2Info, they are a No-code platform which can be used across many different branches. Like logistics, education, production, service providers and more. Using the drag and drop editor no software developers are needed and the implementation time is brought back from months to just weeks.

Last year Any2Info created the Store where partners and customers can download templates. These templates can be used to quickly create a new form/dashboard of a combination of both, to be used in the drag and drop editor. To manage these templates we created a very basic management page, this page needs to be replaced by a more user friendly interface with an API connected to it.

My internship was excellent. Company based in Roermond and it was a challenging project that is being used in production right now. I would not want to change anything about the way it went. If only I knew more about the research pattern, it would have helped me with my internship research.

Graduation Project

I would like a tech company, that its main product is software. Other than that, the company is not that important. Location is important for me; I don't want to spend half of my day traveling. Preferably nearby Roermond. I want to look for a full stack, backend or mobile project that fits the Software profile. Subject is not that important also.

My plan is first to orientate in the field and see what possibilities are out there, starting now. By the end of this semester (before spring break 2023) I want to have noted down a couple interesting companies and projects, but they are not definitive. At the start of the new semester (Minor sem. 7) look again for new companies / projects and ask nearby interesting (Roermond) tech companies for internship availability. Finally, I should have a good amount of choice and can choose one to my liking.
